257 <xs:complexType xmlns:xs="http://www.w3.org/2001/XMLSchema" name="SoftwareComponent"
258     abstract="true">
259     <xs:annotation>
260         <xs:documentation>A SoftwareComponent is an abstract component from which all other components derive. It represents
and generates output data. A SoftwareComponent can include nested "child" components. Every component can have "componentProperties"
scientific properties that a component simulates (for example, temperature, pressure, etc.) and the numerical properties that a component
performs its simulation (for example, the force of gravity). A SoftwareComponent can also have a Deployment, which describes the
computing resources. And a SoftwareComponent can have a composition, which describes how ComponentProperties are composed of
SoftwareComponents or external data files. The properties specified by a component's composition must be owned by the component;
component; child components cannot couple together their parents' properties.</xs:documentation>
